

THE FULL FLOW PIPELINE UPDATE

MAY 2026

WATER TREATMENT PLANT UPGRADE

Part 1 of the water treatment plant upgrade involved relocating the existing filter bank and installing it on the first side of the plant. This stage was prioritised to make sure the local water supply remained fully operational with no interruptions during the works.

With one side now complete, attention has turned to the installation of the new filter banks. The project is really starting to take shape, with new pipework being fabricated for a precise fit, filters positioned into place, and electrical pre-wiring underway.

The new pipework has now been sent away for final welding and protective coating to ensure long-term durability and reliability for years to come. Once commissioned, the new filter banks will significantly improve the plant's performance, with the capability to process up to 320m³ per hour through 130-micron filter stacks.

INDUSTRIAL VALVE PILOT TUBE UP

Along with the servicing of industrial valves, the importance of a pilot and the Stainless Steel tubing will ensure that the valve is functioning correctly for its purpose.

Our team use stainless as it is durable, will last under the tough conditions that a valve gets put through.

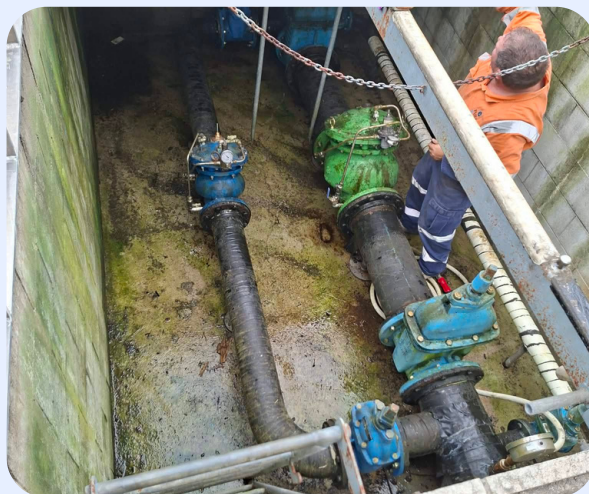

All valves that we work on will be having this upgrade over time.

INDUSTRIAL VALVE SERVICING

The team have covered quite a few kms this month completing industrial valve servicing for two District Councils.

Over 4 days, 5 valve re-tubes, 3 full services and a tune up on another 2.

830 kms for this round trip and an amazing sunset on the way home.

PRV YEARLY CHECKS

Yearly pressure reducing valve checks are a good way to ensure that your potable water system stays maintained.

We look out for – site access, isolations are in place, pressure gauges are working correctly, valves and pilots are not leaking and then a report goes back to council for recommendations on servicing if required.
